- ▶ Note that *p* = 1.01 − .95
- And 1 p = 1.05 1.01

▶ Note that (1.05)p + (.95)(1 - p) = 1.01 when p = .6

- ▶ Note that *p* = 1.01 − .95
- And 1 p = 1.05 1.01
- Why do we care?

- Note that (1.05)p + (.95)(1 p) = 1.01 when p = .6
 - ▶ Note that *p* = 1.01 − .95
 - And 1 p = 1.05 1.01
- Why do we care?
 - With these probabilities, the expected value of any portfolio of \$ and € has expected increase of 1%

- ▶ Note that (1.05)p + (.95)(1 p) = 1.01 when p = .6
 - ▶ Note that *p* = 1.01 − .95
 - And 1 p = 1.05 1.01
- Why do we care?
 - With these probabilities, the expected value of any portfolio of \$ and € has expected increase of 1%
 - Then, the hedging portfolio has expected value:

 $0.6 \cdot 50 + 0.4 \cdot 0 = 30$

- Note that (1.05)p + (.95)(1 p) = 1.01 when p = .6
 - ▶ Note that *p* = 1.01 − .95
 - And 1 p = 1.05 1.01
- Why do we care?
 - With these probabilities, the expected value of any portfolio of \$ and € has expected increase of 1%
 - Then, the hedging portfolio has expected value:

$$0.6 \cdot 50 + 0.4 \cdot 0 = 30$$

(日) (同) (三) (三) (三) (○) (○)

• The present-day value is $\$\frac{30}{1.01} = \29.70

- Note that (1.05)p + (.95)(1 p) = 1.01 when p = .6
 - ▶ Note that *p* = 1.01 − .95
 - ▶ And 1 − p = 1.05 − 1.01
- Why do we care?
 - With these probabilities, the expected value of any portfolio of \$ and € has expected increase of 1%
 - Then, the hedging portfolio has expected value:

 $0.6 \cdot 50 + 0.4 \cdot 0 = 30$

- The present-day value is $\$\frac{30}{1.01} = \29.70
- This is referred to as risk-neutral pricing

► Suppose that the
$$\in 1 = \$\frac{1.05}{.95}$$

Suppose that the
$$\in 1 = \$ \frac{1.05}{.95}$$

• Exchange rate will either go up to $\frac{(1.05)^2}{.95}$ or down to \$1.05
