From Apostol, read Chapter 13, sections 1-7.

1. From Apostol, 13.5, page 477: do problems 1, 4, 7.
2. From Apostol, 13.8, pages 482-483: do problems 1, 3, 10, 12.
3. Let $v_{1}, v_{2}, v_{3} \in \mathbb{R}^{3}$. Suppose that $v_{1}$ and $v_{2}$ are non-zero orthogonal vectors, and let $P$ be the span of $\left\{v_{1}, v_{2}\right\}$. For $i=1,2$ let $a_{i}=v_{3} \cdot v_{i} /\left\|v_{i}\right\|^{2}$, and let $w=a_{1} v_{1}+a_{2} v_{2}$.
a) Show that $P$ is a plane through the origin.
b) Show that $w$ is the orthogonal projection of $v_{3}$ onto $P$; i.e. that $v_{3}-w$ is orthogonal to every vector in the plane.
c) Show that $w$ is the closest point to $v_{3}$ on $P$.
d) Interpret parts (b) and (c) in the special case that $v_{3}$ lies in $P$, and explain why those parts were already known by a previous result in that case.
4. Show that the points of a line in $\mathbb{R}^{n}$ satisfy all the laws of a vector space (see Axioms $1-10$, section 15.2, pages 551-552 of Apostol) if and only if the line contains the origin.
5. a) Let $L$ be a line in $\mathbb{R}^{2}$. Prove that the set of vectors in $L$ spans $\mathbb{R}^{2}$ if and only if $L$ does not contain the origin.
b) State and prove an analog for planes in $\mathbb{R}^{3}$.
c) What about lines in $\mathbb{R}^{3}$ ?
