## Homework Set 5

DuE: Thurs. Oct. 19, 2006. Late papers accepted until 1:00 Friday.

1. Let $V$ and $W$ be normed linear spaces and $L: V \rightarrow W$ a linear map, so $L(X+Y)=$ $L X+L Y$ and $L(c X)=c L X$. Define the norm of $L$ by

$$
\|L\|:=\sup _{X \neq 0} \frac{\|L X\|_{W}}{\|X\|_{V}}
$$

We say that $L$ is bounded if $\|L\|<\infty$
a) The set $\mathcal{L}(V, W)$ of all linear maps from $V$ to $W$ is itself a linear space - since one can add maps, $L+M$, and multiply them by scalars, $c L$. Show that $\|L\|$ defines a norm on $\mathcal{L}(V, W)$, that is,
i). $\|L\| \geq 0$, with $\|L\|=0$ only if $L=0$,
ii). $\|c L\|=|c|\|L\|$ for any scalar $c$,
ii). $\|L+M\| \leq\|L\|+\|M\|$ (triangle inequality).
b) Show that $\|L\|=\sup _{\|X\|_{V}=1}\|L X\|_{W}$.
c) Let $A=\left(\begin{array}{rrr}0 & 1 & -1 \\ 1 & 2 & 0\end{array}\right)$ define a linear map from $\mathbb{R}^{3}$ to $\mathbb{R}^{2}$ with the usual euclidean norms. Show that $A$ is bounded. (You need not compute $\|A\|$, only get an upper bound for it).
d) If $L: \mathbb{R}^{k} \rightarrow \mathbb{R}^{n}$ is given by any $n \times k$ matrix and both $\mathbb{R}^{k}$ and $R^{n}$ have the Euclidean norm, show that $L$ is bounded.
e) Show that if $L: \ell_{2} \rightarrow \ell_{2}$ is defined by

$$
L X:=\left(c_{1} x_{1}, c_{2} x_{2}, c_{3} x_{3}, \ldots\right)
$$

where $c_{j}$ is a bounded sequence, then $L$ is bounded.
f) Show that if $L: \ell_{2} \rightarrow \ell_{2}$ is defined by

$$
L X:=\left(x_{1}, 2 x_{2}, \ldots, n x_{n}, \ldots\right)
$$

is not a bounded linear map.
2. Let $f: \mathbb{R} \rightarrow \mathbb{R}$ have the property that $|f(x)-f(\hat{x})|<c|x-\hat{x}|$ for all real $x$, $\hat{x}$, and where $c$ is a constant. Given any starting point $x_{0}$, define $x_{j}, j=1,2, \ldots$, recursively by the rule

$$
x_{j+1}=f\left(x_{j}\right)
$$

If $c<1$, prove that the $x_{j}$ converge to some real number.
3. a) Let $A$ be a subset of the real numbers. Prove that the following statements are equivalent:

- $A$ is closed.
- Every sequence $x_{n} \in A$ such that $\sum_{n=1}^{\infty}\left\|x_{n+1}-x_{n}\right\|<\infty$ converges to a limit in $A$.
b) Show this is also true for subsets $A$ of the plane $\mathbb{R}^{2}$ with the usual euclidian norm.

4. Let $\ell_{2}$ be the usual normed linear space space of infinite sequences sequences $X=$ $\left(x_{1}, x_{2}, \ldots\right)$ with finite norm: $\|X\|:=\sqrt{\sum_{j=1}^{\infty}\left|x_{j}\right|^{2}}<\infty$. Prove that $\ell_{2}$ is complete. [SUGGESTION: See the similar proof that $\ell_{1}$ is complete on the class web page.]
