-

Given a differential equation y'' + P(x)y' + Q(x)y = 0

#### Definition

A point  $x_0$  is an **ordinary point** if both P(x) and Q(x) are analytic at  $x_0$ . If a point in not ordinary it is a **singular point**.

Given a differential equation y'' + P(x)y' + Q(x)y = 0

#### Definition

A point  $x_0$  is an **ordinary point** if both P(x) and Q(x) are analytic at  $x_0$ . If a point in not ordinary it is a **singular point**.

#### Definition

A point  $x_0$  is a **regular singular point** if the functions  $(x - x_0)P(x)$ and  $(x - x_0)^2Q(x)$  are both analytic at  $x_0$ . Otherwise  $x_0$  is irregular.

#### Review

#### Theorem

(Frobenius' Theorem)

If  $x_0$  is a regular singular point of y'' + P(x)y' + Q(x)y = 0, then there exists a solution of the form

$$y = \sum_{n=0}^{\infty} c_n (x - x_0)^{n+r}$$

where r is some constant to be determined and the power series converges on a non-empty open interval containing  $x_0$

#### Review

#### Theorem

(Frobenius' Theorem)

If  $x_0$  is a regular singular point of y'' + P(x)y' + Q(x)y = 0, then there exists a solution of the form

$$y = \sum_{n=0}^{\infty} c_n (x - x_0)^{n+r}$$

where r is some constant to be determined and the power series converges on a non-empty open interval containing  $x_0$ 

To solve y'' + P(x)y' + Q(x)y = 0 at a regular singular point  $x_0$ , substitute

$$y = \sum_{n=0}^{\infty} c_n (x - x_0)^{n+r}$$

and solve for r and the  $c_n$  to find a series solution centered at  $x_{0}$ .

# Indicial Roots

Ryan Blair (U Penn)

To find the r in  $y = \sum_{n=0}^{\infty} c_n (x - x_0)^{n+r}$  we substitute the series into y'' + P(x)y' + Q(x)y = 0 and equate the total coefficient of the lowest power of x to zero. This will be a quadratic equation in r.

# Indicial Roots

To find the r in  $y = \sum_{n=0}^{\infty} c_n (x - x_0)^{n+r}$  we substitute the series into y'' + P(x)y' + Q(x)y = 0 and equate the total coefficient of the lowest power of x to zero. This will be a quadratic equation in r.

The roots,  $r_1$  and  $r_2$ , we get are the **indicial roots** of  $\mathbf{v}'' + P(\mathbf{x})\mathbf{v}' + Q(\mathbf{x})\mathbf{v} = \mathbf{0}$

### Cases

Ryan Blair (U Penn)

**Case 1:** If  $r_1$  and  $r_2$  are distinct and do not differ by an integer, then we get two linearly independent solutions

$$y_1 = \sum_{n=0}^{\infty} c_n (x - x_0)^{n+r_1}$$
 and  $y_2 = \sum_{n=0}^{\infty} b_n (x - x_0)^{n+r_2}$
