

Quiz 1 (Tuesday)

a) $y' = (y-a)(y-b)$

$y' = 0$ when $y=a$ or $y=b$ which are the equilibrium points.

b) $y' = y^2 - (a+b)y + ab$

$$y'' = 2yy' - (a+b)y' = y'(2y - (a+b))$$

$$y'' = 0 \text{ when } y = \frac{a+b}{2}, \text{ or } y' = 0 \text{ i.e. } y = a \text{ or } y = b$$

$$\begin{matrix} y' > 0 \\ \leftarrow \end{matrix} \quad \begin{matrix} y' < 0 \\ \bullet \end{matrix} \quad \begin{matrix} y' < 0 \\ \rightarrow \end{matrix} \quad \begin{matrix} y' > 0 \\ \rightarrow \end{matrix}$$

$$\begin{matrix} y'' < 0 & a & y'' > 0, \frac{a+b}{2} & y'' < 0 & b & y'' > 0 \\ \downarrow & \downarrow & \downarrow & \downarrow & \downarrow & \downarrow \end{matrix}$$

Note: $\frac{a+b}{2}$ isn't an equilibrium point.

- c) a is stable as y' is positive to the left and negative to the right of a .
 b is unstable as $y' < 0$ on the left and $y' > 0$ on the right.

d)
